

Euclidean geometry

Wai-Shing Luk

2016-11-30

Basic

- Line at infinity $l_{\infty} = [0, 0, 1]$
- Two special points **I** and **J** on l_{∞} play an important role in Euclidean Geometry:
 - $\mathbf{I} = [-i, 0, 0], \mathbf{J} = [i, 0, 0]$
- $\mathbf{A} = l_{\infty} \cdot l_{\infty}^T$
- $\mathbf{B} = \mathbf{I} \cdot \mathbf{J}^T + \mathbf{J} \cdot \mathbf{I}^T$
- If we choose another line $l = M \cdot l_{\infty}$ as line of infinity

Rational Trigonometry in Euclidean geometry

Notations

- To distinguish with Euclidean geometry, points are written in capital letters.

Quadrance and Spread in Euclidean geometry

- The **quadrance** Q between points A_1 and A_2 is:

$$Q = (x'_1 - x'_2)^2 + (y'_1 - y'_2)^2$$

- The **spread** s between lines l_1 and l_2 is:

$$s = (a_1b_2 - a_2b_1)^2 / (a_1^2 + b_1^2)(a_2^2 + b_2^2)$$

- The **cross** c between lines l_1 and l_2 is:

$$c = 1 - s = (a_1a_2 + b_1b_2)^2 / (a_1^2 + b_1^2)(a_2^2 + b_2^2)$$

Triple formulate

- Let A_1, A_2 and A_3 are points with $Q_1 \equiv Q(A_2, A_3)$, $Q_2 \equiv Q(A_1, A_3)$ and $Q_3 \equiv Q(A_1, A_2)$. Let l_1, l_2 and l_3 are lines with $s_1 \equiv s(l_2, l_3)$, $s_2 \equiv s(l_1, l_3)$ and $s_3 \equiv s(l_1, l_2)$.
- Theorem (Triple quad formula): If A_1, A_2 and A_3 are collinear points then

$$(Q_1 + Q_2 + Q_3)^2 = 2(Q_1^2 + Q_2^2 + Q_3^2)$$

- Theorem (Triple spread formula): If l_1, l_2 and l_3 are concurrent lines then

$$(s_1 + s_2 + s_3)^2 = 2(s_1^2 + s_2^2 + s_3^2) + 4s_1s_2s_3.$$

Spread Law and Cross Law

- Suppose that triangle $\{A_1 A_2 A_3\}$ form quadrances $Q_1 \equiv Q(A_2, A_3)$, $Q_2 \equiv Q(A_1, A_3)$ and $Q_3 \equiv Q(A_1, A_2)$, and it dual trilateral $\{l_1 l_2 l_3\}$ form spreads $s_1 \equiv s(l_2, l_3)$, $s_2 \equiv s(l_1, l_3)$ and $s_3 \equiv s(l_1, l_2)$. Then:

- Theorem (Spread Law)

$$s_1/Q_1 = s_2/Q_2 = s_3/Q_3.$$

- Theorem (Cross law)

$$(Q_1 + Q_2 - Q_3)^2 = 4Q_1 Q_2 (1 - s_3).$$

- (Compare with the Cosine law)

$$d_3^2 = d_1^2 + d_2^2 - 2d_1 d_2 \cos \theta_3.$$

Right triangles and Pythagoras

- Suppose that $\{A_1 A_2 A_3\}$ is a right triangle with $s_3 = 1$. Then
- Theorem (Thales)

$$s_1 = Q_1/Q_3 \text{ and } s_2 = Q_2/Q_3.$$

- Theorem (Pythagoras)

$$Q_3 = Q_1 + Q_2.$$

Archimedes' function

- Archimedes' function $A(Q_1, Q_2, Q_3)$

$$A(Q_1, Q_2, Q_3) = (Q_1 + Q_2 + Q_3)^2 - 2(Q_1^2 + Q_2^2 + Q_3^2)$$

- Non-symmetric but more efficient version:

$$A(Q_1, Q_2, Q_3) = 4Q_1Q_2 - (Q_1 + Q_2 - Q_3)^2$$

Theorems

- Theorem (Archimedes' formula): If $Q_1 = d_1^2$, $Q_2 = d_2^2$ and $Q_3 = d_3^2$, then $A(Q_1, Q_2, Q_3)$

$$= (d_1 + d_2 + d_3)(d_1 + d_2 - d_3)(d_2 + d_3 - d_1)(d_3 + d_1 - d_2)$$

Theorems (cont'd)

- Theorem: As a quadratic equation in Q_3 , the TQF $A(Q_1, Q_2, Q_3) = 0$ can be rewritten as:

$$Q_3^2 - 2(Q_1 + Q_2)Q_3 + (Q_1 - Q_2)^2 = 0$$

- Theorem: The quadratic equations

$$(x - p_1)^2 = q_1$$

and

$$(x - p_2)^2 = q_2$$

has a common solutions iff $A(q_1, q_2, (p_1 - p_2)^2) = 0$

Heron's formula (Hero of Alexandria 60BC)

- The area of a triangle with side lengths a, b, c is

$$\text{area} = \sqrt{s(s-a)(s-b)(s-c)}$$

where $s = (a + b + c)/2$ is the semi-perimeter.

{#fig:heron}

Archimedes' theorem

- The area of a planar triangle with quadrances Q_1, Q_2, Q_3 is given by

$$16(\text{area})^2 = \mathcal{A}(Q_1, Q_2, Q_3)$$

- Note: Given Q_1, Q_2 . The area is maximum precisely when $Q_3 = Q_1 + Q_2$

.

Brahmagupta's formula (convex)

- Brahmagupta's theorem:

$$\text{area} = \sqrt{(s-a)(s-b)(s-c)(s-d)}$$

where $s = (a + b + c + d)/2$

- Preferred form:

$$16\text{area}^2 = (-a + b + c + d)(a - b + c + d)(a + b - c + d)(a + b + c - d)$$

Quadratic compatibility theorem

- Two quadratic equations

$$(x - p_1)^2 = q_1, \quad (x - p_2)^2 = q_2$$

are compatible iff

$$[(p_1 + p_2)^2 - (q_1 + q_2)]^2 = 4q_1q_2$$

or

$$\mathcal{A}(q_1, q_2, (p_1 - p_2)^2) = 0$$

- In this case, if $p_1 \neq p_2$ then there is a unique sol'n:

$$2x = (p_1 + p_2) - (q_1 - q_2)/(p_1 - p_2)$$

Quadruple Quad Formula

- Quadruple Quad Formula $Q(a, b, c, d)$

$$= [(a + b + c + d)^2 - 2(a^2 + b^2 + c^2 + d^2)]^2 - 64abcd$$

- Note that

$$(a + b + c + d)^2 - 2(a^2 + b^2 + c^2 + d^2) = 4(ab + cd) - (a + b - c - d)^2$$

Brahmagupta's formula

- Brahmagupta's formula (convex):

$$B(a, b, c, d) = (b + c + d - a)(a + c + d - b)(a + b + d - c)(a + b + c - d)$$

- Robbin's formula (non-convex):

$$R(a, b, c, d) = (a + b + c + d)(a + b - c - d)(a - b + c - d)(b + c - a - d)$$

- quadrea $A = 16(\text{area})^2$
- Brahmagupta's identity

$$Q(a^2, b^2, c^2, d^2) = B(a, b, c, d) \cdot R(a, b, c, d)$$

Cyclic quadrilateral quadrea theorem

$$A^2 - 2mA + p = 0$$

where

$$\begin{aligned} m &= (Q_{12} + Q_{23} + Q_{34} + Q_{14})^2 - 2(Q_{12}^2 + Q_{23}^2 + Q_{34}^2 + Q_{14}^2) \\ &= 4(ab + cd) - (a + b - c - d)^2 \\ &= 4(Q_{12}Q_{23} + Q_{34}Q_{14}) - (Q_{12} + Q_{23} - Q_{34} - Q_{14})^2 \\ p &= Q(Q_{12}, Q_{23}, Q_{34}, Q_{14}) \end{aligned}$$

Ptolemy's theorem & generalizations

- **Claudius Ptolemy**: 90-168 A.D. (Alexandria) Astronomer & geographer & mathematician
- **Ptolemy's theorem** If $\{ABCD\}$ is a cyclic quadrilateral with the lengths a, b, c, d and diagonal lengths p, q , then

$$a b + c d = p q$$

[Actually needs convexity!]

Ptolemy's theorem

{#fig:Ptolemy}

Exercise

- Ex. $A_1 = (1, 0)$, $A_2 = (3/5, 4/5)$, $A_3 = (-12/13, 5/13)$,
 $A_4 = (15/17, -8/17)$

- Then the quadrances are:

$$Q_{12} = 4/5, Q_{23} = 162/65, Q_{34} = 882/221, Q_{14} = 4/17$$

- The diagonal quadrances are:

$$Q_{24} = 144/85, Q_{13} = 50/13$$

Ptolemy's theorem (rational version)

- Ptolemy's theorem (rational version): If $A_1A_2A_3A_4$ is a cyclic quadrilateral with quadrances $Q_{ij} \equiv Q(A_i, A_j)$, $i, j = 1, 2, 3, 4$ then

$$\mathcal{A}(Q_{12}Q_{34}, Q_{23}Q_{14}, Q_{13}Q_{24}) = 0$$

- Ex. For $A_1 = (1, 0)$, $A_2 = (3/5, 4/5)$, $A_3 = (-12/13, 5/13)$, $A_4 = (15/17, -8/17)$ with

$$Q_{12} = 4/5, Q_{23} = 162/65$$

$$Q_{34} = 882/221, Q_{14} = 4/17$$

$$Q_{24} = 144/85, Q_{13} = 50/13$$

- we can verify directly that $\mathcal{A}(Q_{12}Q_{34}, Q_{23}Q_{14}, Q_{13}Q_{24}) = 0$.
- Note that with the rational form of Ptolemy's theorem, the three quantities appear *symmetrically*: so *convexity* of the cyclic quadrilateral is no longer required!
